

Figure 5 (Supplementary). Gender gap in NHYE: method comparison

Diagonal line = perfect agreement. r = Pearson correlation between country-level NHYE gaps across methods.
Sullivan vs CAL: $r \geq 0.997$ for all dimensions (same prevalence data; period vs cohort survivorship barely differs).
Sullivan vs Multistate: $r = 0.40\text{--}0.92$ (different prevalence estimation method). Gender gap = female minus male, age 50.
